INTRODUCTION

Software engineer with 10 years building production systems, from junior to senior engineer. Architected and shipped the company's modern core products in a Node.js/TypeScript stack, with an emphasis on immutability, concurrency, and pragmatic design. Comfortable across the stack, from optimizing a polling backend to designing and building complex data visualizations.

EXPERIENCE

CodeMettle

Atlanta, GA

Network management and visualization software; ~70 employees; primarily a DoD subcontractor.

Senior Engineer

2023 – July 2026

- **Technical Direction:** Served as the technical authority for a team of 5 (out of 15 total engineers), setting architecture, standards, and the roadmap while staying hands-on in core TypeScript and Go codebases.
- **DevEx & AI:** Worked with fellow engineers to find the best ways to fit coding agents into the engineering workflow without compromising quality. This included adoption of AI-assisted, test-driven development, reducing ticket-to-PR time and raising test coverage from 60% to 90% while keeping deliveries on pace.

Software Engineer

2020 – 2023

- **Modernization:** Led the rewrite of the legacy Java/Play application into Node.js/TypeScript, porting 7 services with 5 other engineers. Cut build times from over an hour down to under 10 minutes. Improved internal code standards and repository organization. Staggered customer migrations, using a strangler-fig approach when possible.
- **Mentor:** Authored onboarding documentation and mentored new engineers, cutting onboarding time from roughly one week to 1–3 days. Onboarded 3 new developers and 8 interns in that time.

Systems Engineer

2017 – 2020

- **Full-Stack Environment:** Built services, backend logic, APIs, and visualizations across multiple stacks under tight deadlines. Bridged product, design, integrators, and end users as the engineering point of contact.
- **Travel (~30%):** Over a 2-year span, spent 1–2 months at a time on-site at 4 overseas customer deployments to serve as the engineering subject-matter expert. Prototyped mission-planning capabilities that became core features.

Project Engineer

August 2016 – 2017

- **Project Lead:** Deployed 2 production-ready systems to customers while leading a team of 2–3 developers. Involved visiting satellite teleports and modem vendors to install and validate on-site.
- **Hardware Integration:** Translated live satellite-infrastructure data into well-defined databases using Python.

PROJECTS

Polling Backend: Architected asynchronous subprocesses in a Node.js backend to ingest device data across protocols (SSH, SNMP, HTTP, streaming, serial, TCP, UDP, and WebSocket), scaling from 10–50 devices (hundreds of changes/sec) to ~500 devices (thousands of changes/sec) in production.

Flows: Developed an external domain-specific language and event-driven architecture that let users define secure polls, data transformation/validation, and rules.

Data Visualizations: Built geographical and logical network graphs (D3, Mapbox, cytoscape.js, React Flow) rendering hundreds of nodes/edges across 4–5 datasources: tx/rx, alarms, OSPF/BGP changes, and geospatial. Wrote Grafana datasource plugins for Apache Solr and MongoDB.

FIPS: Built an optional FIPS-compliant mode enforcing BouncyCastle in Java and compiling Node and Go binaries against FIPS crypto chains. Required for DoD Authority to Operate (ATO).

SKILLS

Languages & Libraries: TypeScript, Python, Java, Bash, C, HTML/CSS/JS, Effect-TS, Go, Immutable.js

Technologies & Frameworks: Node.js, JSON Schema, Express, React, Jest, RHEL, OpenAPI, MongoDB, SQL, Docker

Methods: npm workspaces, Nx, Git, Agile, GitLab CI, Claude Code, Snyk, Renovate, ESLint/Prettier

EDUCATION

Georgia State University

Atlanta, GA

Bachelor of Science in Computer Science; Dean's List; GPA: 3.43

Graduated May 2015
